

CROSSPOST HELPER · A DESKTOP APP FOR ARTISTS WHO POST

From the render to the post.

One library for every picture you make, a fair way to choose what goes out next, posts written for the picture and the account, and a clear view of who you are posting for.

- **Sort a batch in minutes:** keep the good ones, bin the rest, compare a series side by side.
- **Never post the same picture twice** to the same account by accident.
- **Posts that fit the picture:** engagement, story, good morning, QT, in the tone you choose.
- **Edit, upscale and animate** without leaving the app.
- **Windows · macOS · Linux.** Your pictures and your data stay on your own disk.

THE IDEA

Making pictures is the fun part. Everything after it is this app.

A generator writes hundreds of pictures into a folder. Then the real work starts: which ones are good, which have already gone out, which account gets which, what to write, and who to tag. Crosspost Helper keeps that whole walk in one place, and every step knows what the one before it decided.

01
Triage
keep the good ones, bin the rest

02
Library
everything you kept, findable

03
Picker
what goes out next, per account

04
Post
written for the picture

05
Send
X, Bluesky, Civitai, DeviantArt

06
Social
QTs, people, what landed

LOCAL FIRST

Your files stay where they are

The app watches your folders and builds its library beside them. Nothing is uploaded unless you post it, and the database is a file on your own computer, with backups.

ACCOUNT AWARE

Every account has its own history

A picture that went to Bluesky is still new to X. Each account keeps its own record of what it has had, what it skipped and what it should never get.

BRING YOUR OWN KEYS

Pay only for what you use

AI writing, upscaling and video run on your own accounts with the providers you choose. Without a key, the library, the picker and posting all work.

01 · TRIAGE

A batch of 300, sorted in minutes

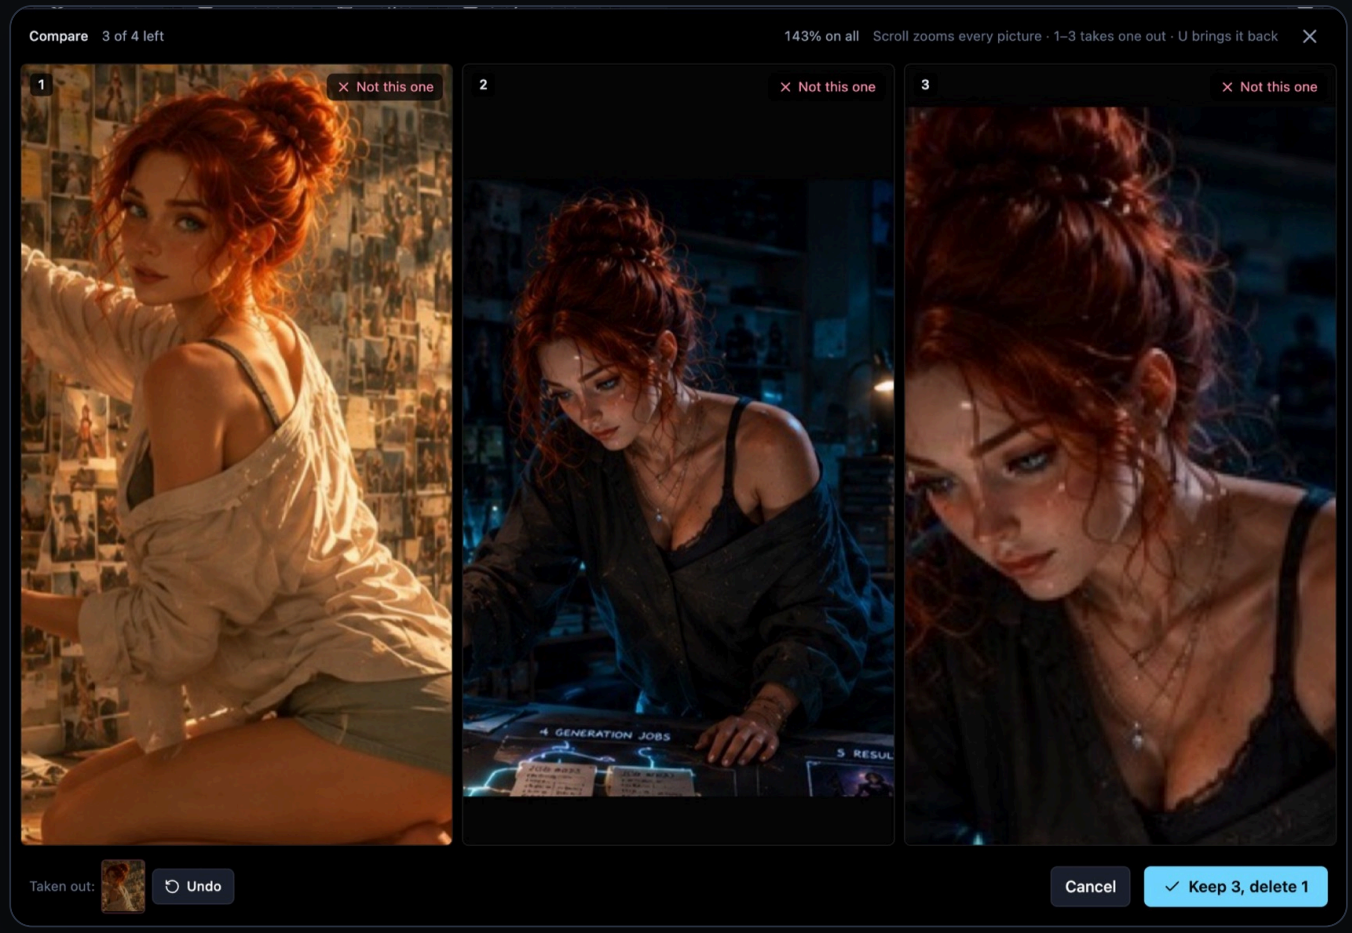

New renders land in Triage before they reach your library. Mark the whole batch for deletion, then pick out the keepers. Nothing happens until you press Apply, and deleted files go to the trash.

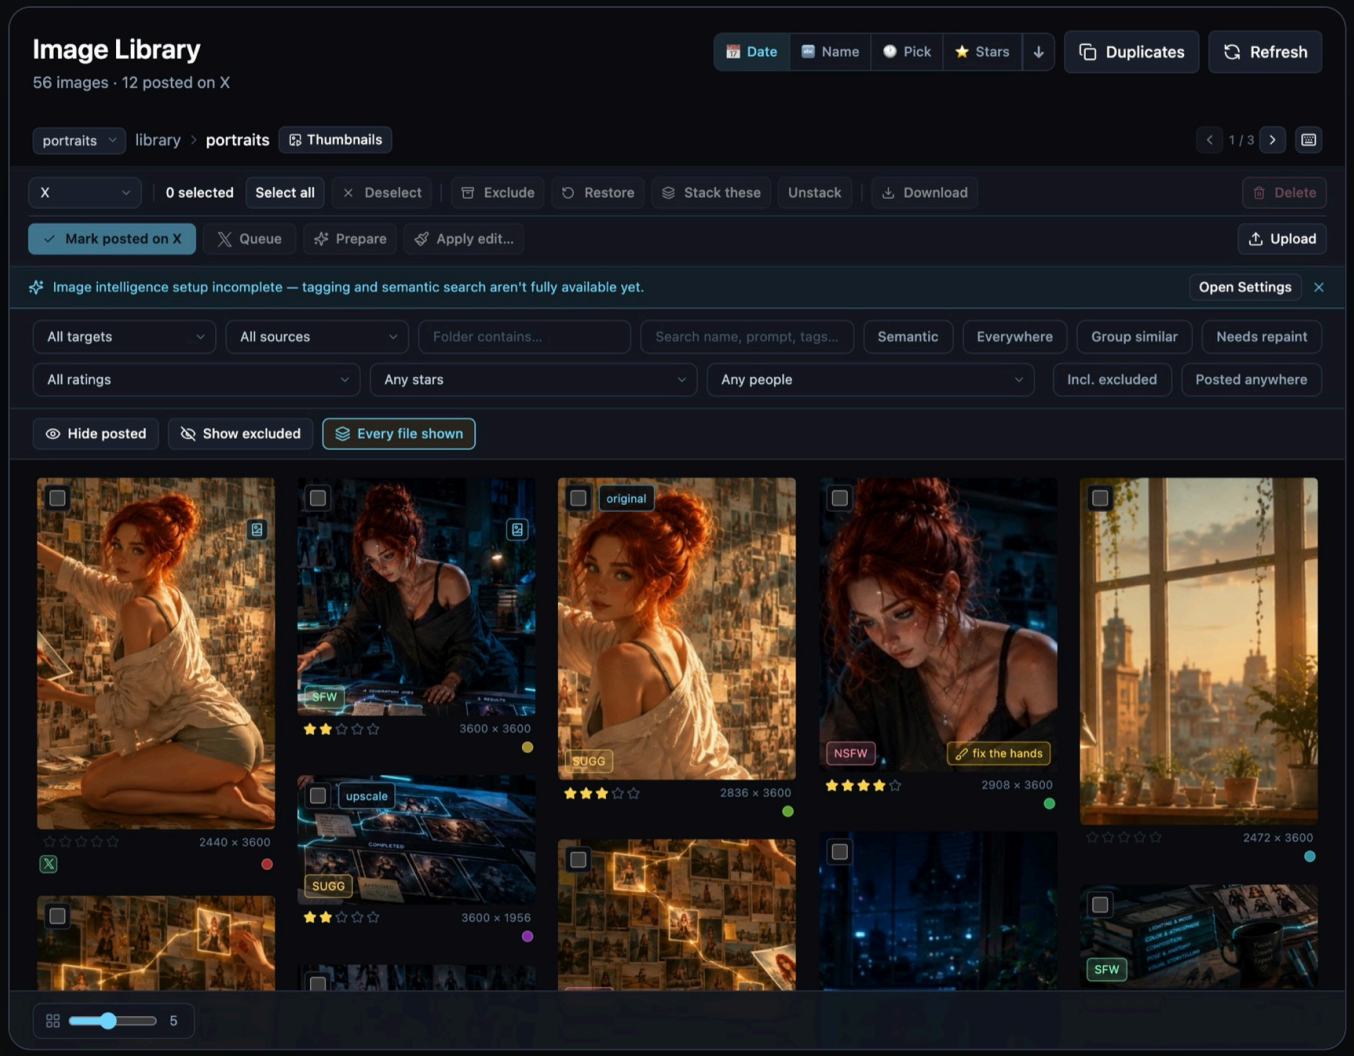

Compare a series side by side
Put up to four pictures of one batch next to each other, zoom all of them at once, and take out the ones you would not keep.

Decide with the keyboard
K keep, D delete, 1–5 stars, N for the next undecided picture.

Finds what arrived while the app was closed
It looks when it starts and when you switch back to it.

Bring pictures in any way
Watched folders, drag and drop, paste, a folder import, or your own ChatGPT data export.

02 · LIBRARY

Every picture, and what it has been through

Each tile shows the stars you gave it, how explicit it is, its size, and which accounts it has already gone out on.

Stacks
An original, its upscale and its edit are one picture with several files. Post one and the whole stack counts as posted.

Search by what is in it
Local tagging and semantic search: type "redhead by a window at sunset" and find it, prompt or not.

Duplicates, sorted out
Near-identical copies are grouped, and the one that carries the prompt is suggested as the keeper.

Filters that say what they do
By account, stars, rating, colour, tags, people, folder and date, with every active filter named above the grid.

03 · PICKER

What goes out next, chosen fairly

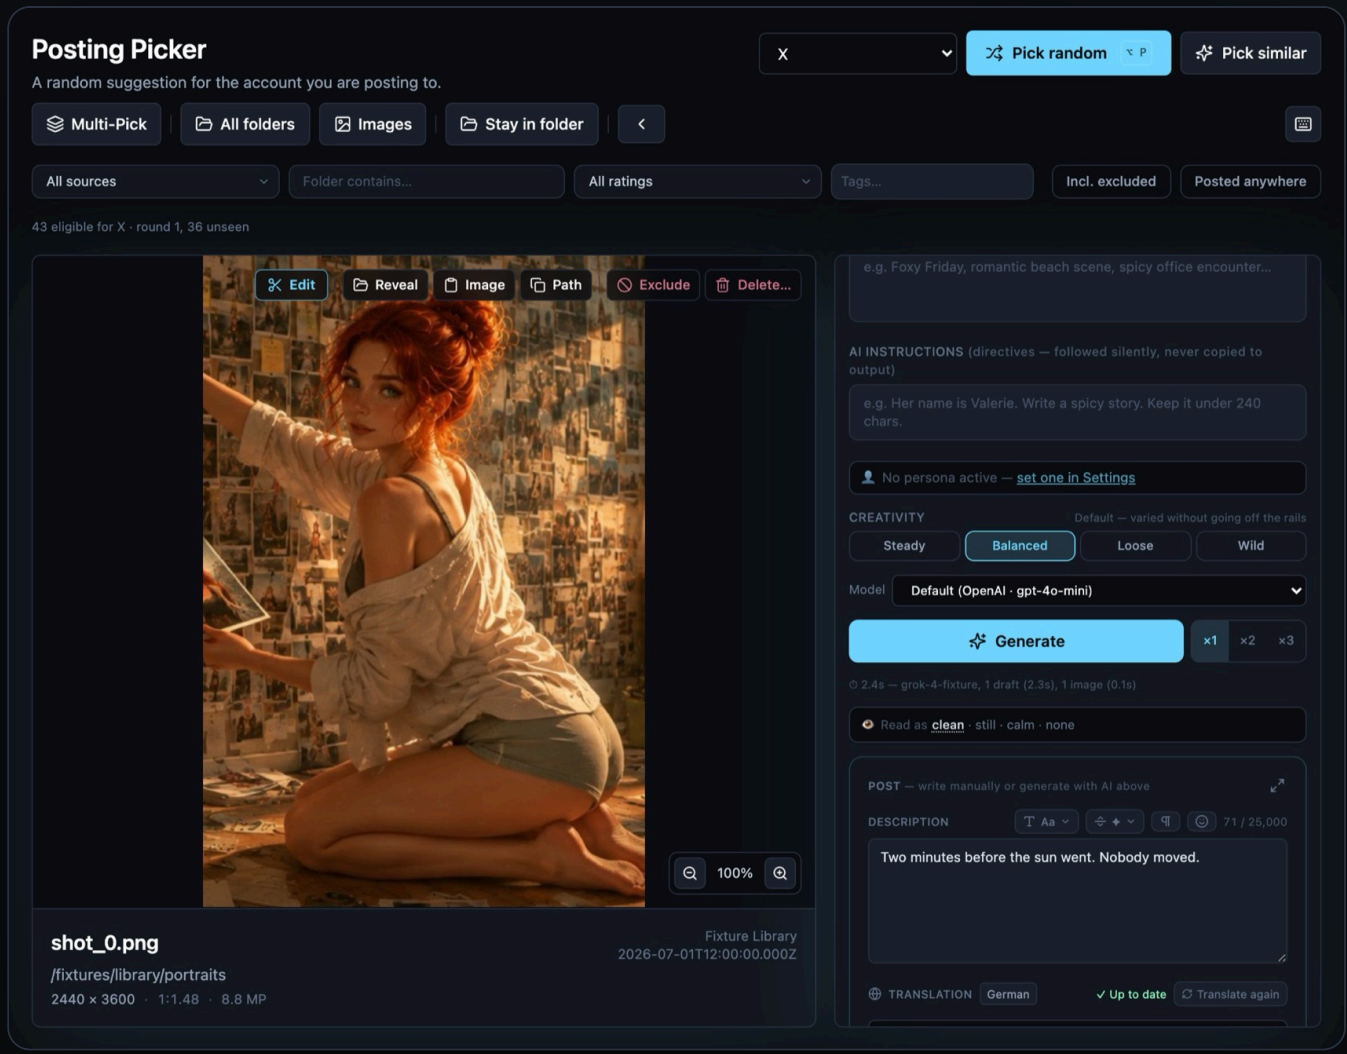

Choose an account and press Pick random. You get a picture that account has not had yet, and every picture comes round once before any comes round twice.

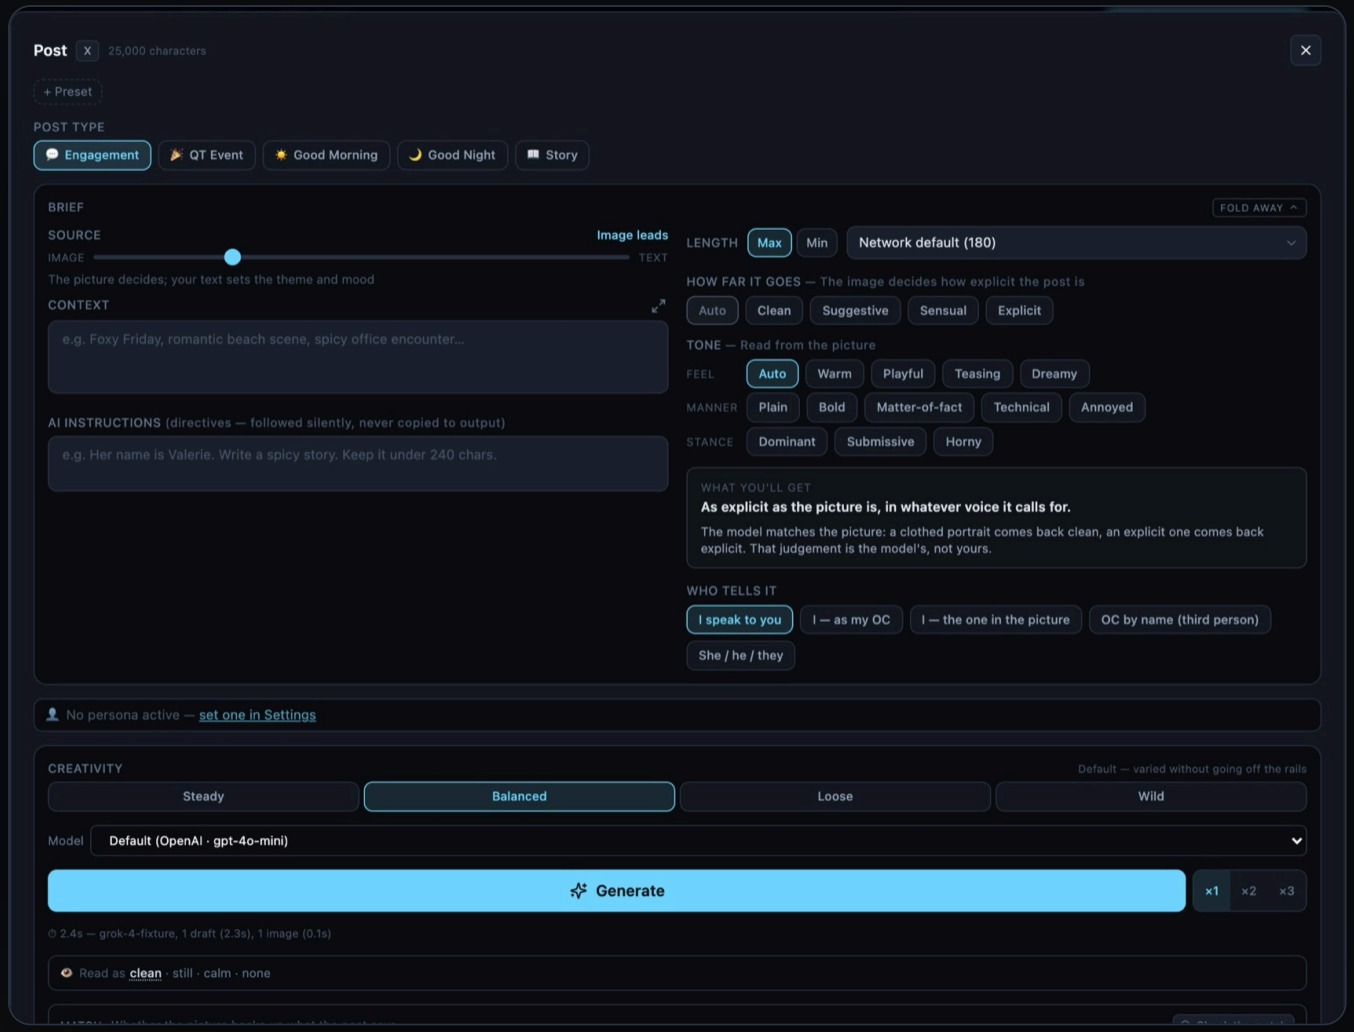

Rules per account
Keep one account clean, give another only your best, leave a folder out entirely.

Alternatives from the same folder
See the rest of the series, what each account already had, and build a post of up to four pictures.

Saying no has three sizes
Not this round, not for this account, or not at all, and each can be undone.

Posting twice is a choice, not an accident
If this account had this picture before, you are told when, with a link to that post.

04 · WRITING THE POST

Words that fit the picture

The AI looks at the picture and writes the post in the shape you choose. You keep the last word: everything it writes lands in an ordinary text field.

Five kinds of post
Engagement, Story, Good Morning, Good Night and QT, each with its own rules, so a story never turns into a call for likes.

Tone, explicitness and who tells it
Twelve tones, a content level from Clean to Explicit, and the narrator: you, your OC, or the person in the picture.

Your voice
A persona learned from posts you wrote yourself.

Read it in your own language
Every draft is translated back so you know what you are posting.

Your choice of model
OpenAI, Anthropic, Grok or Gemini, and a different one per post if you like.

05 · SENDING

Out to every account, tracked

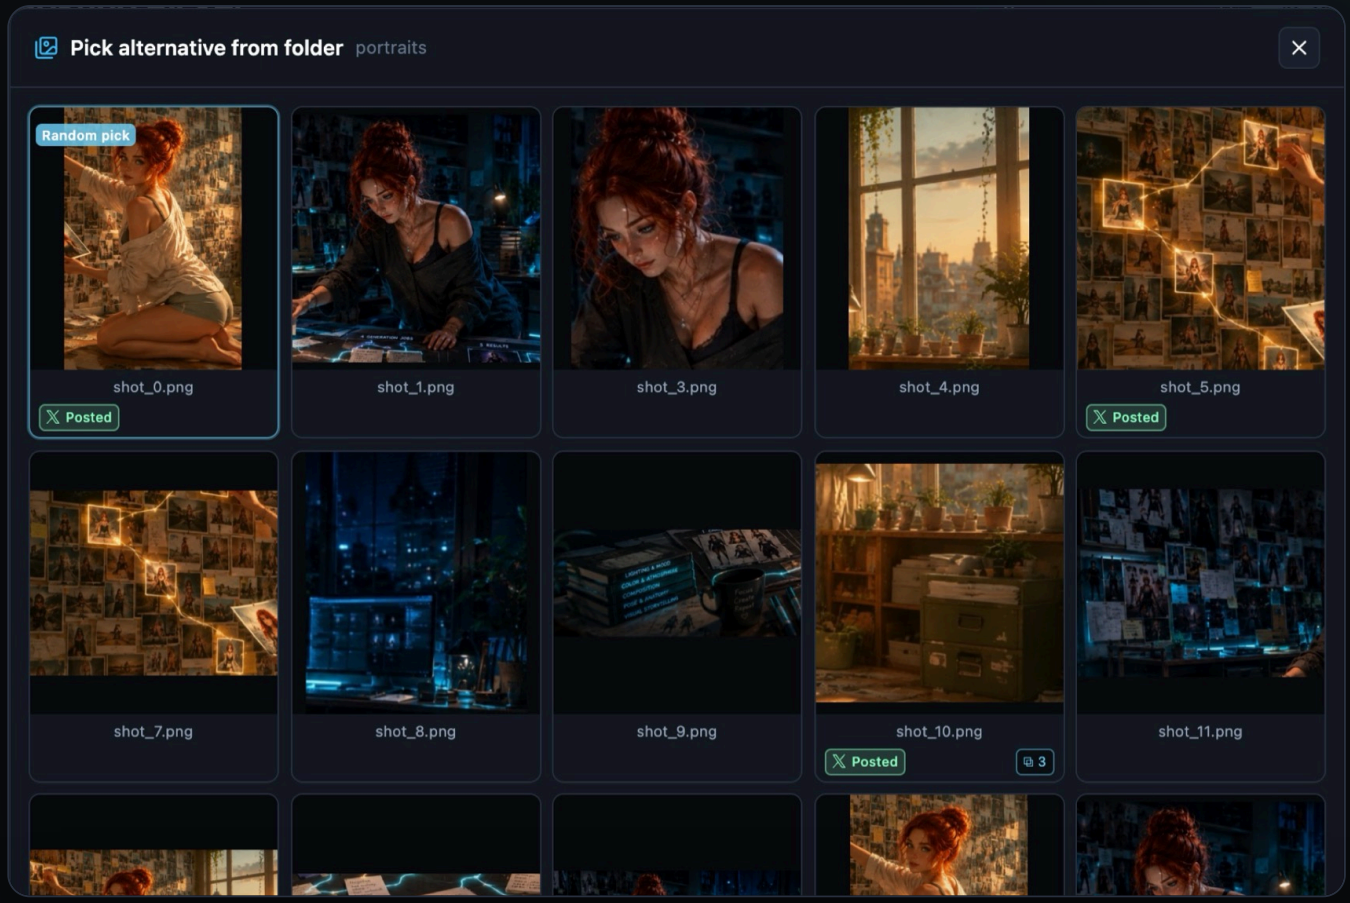

Post directly where a platform allows it, or let the browser extension fill in the composer for you to send yourself. Either way the app records what went where.

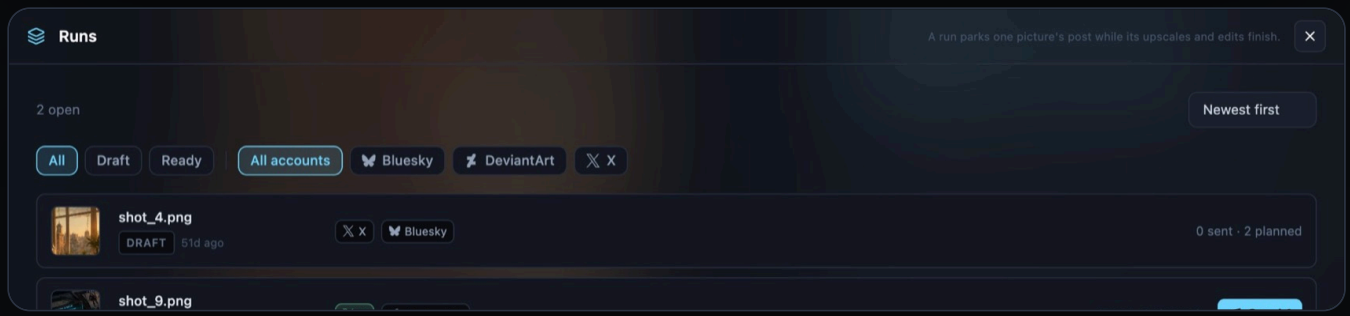

Direct
X, Bluesky and Civitai through their APIs. The price of an X post is shown before you press anything.

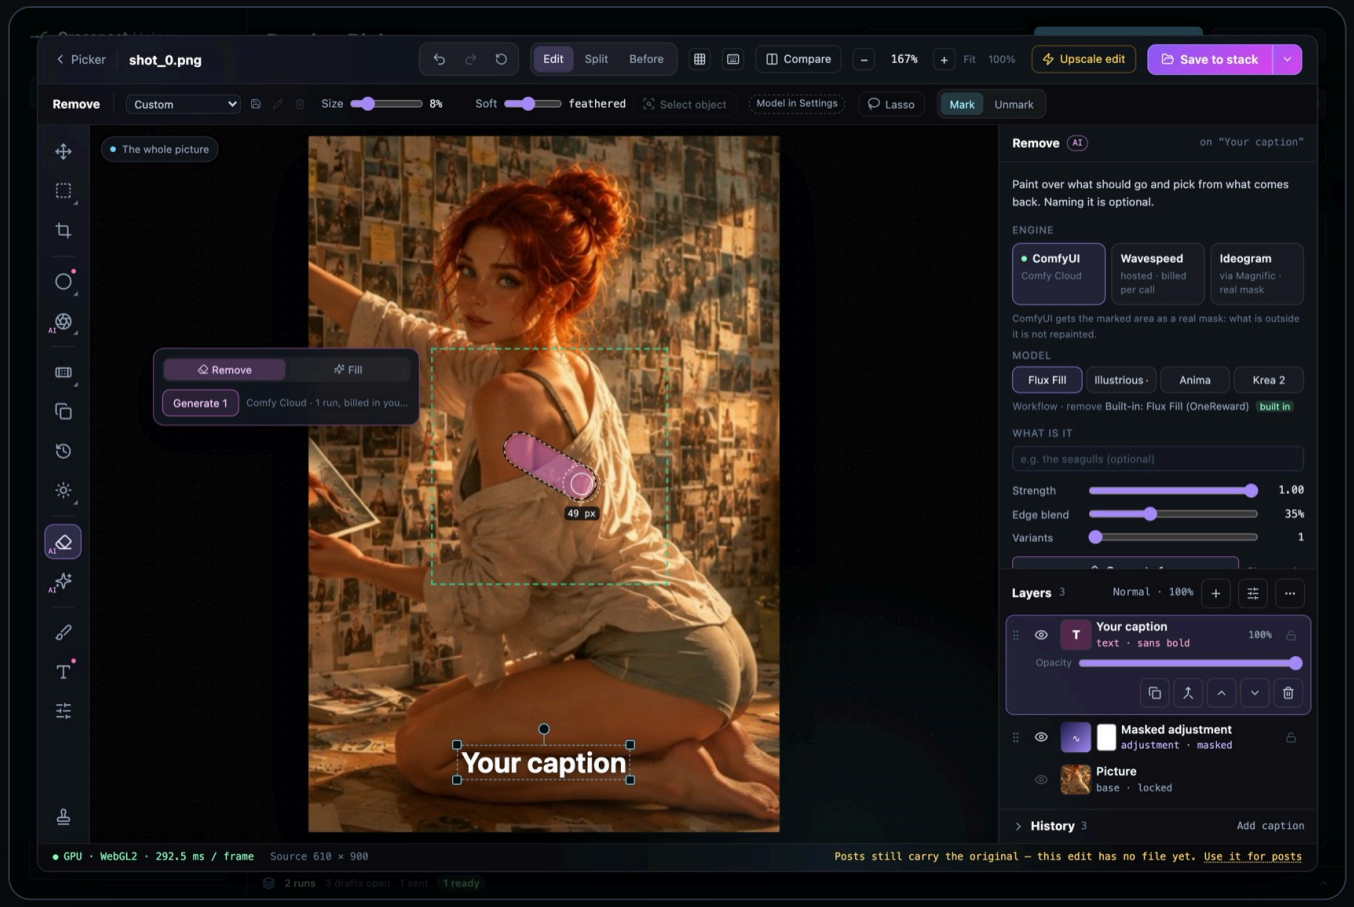

Through your browser
The extension fills the post on X, Bluesky and DeviantArt, pictures included.

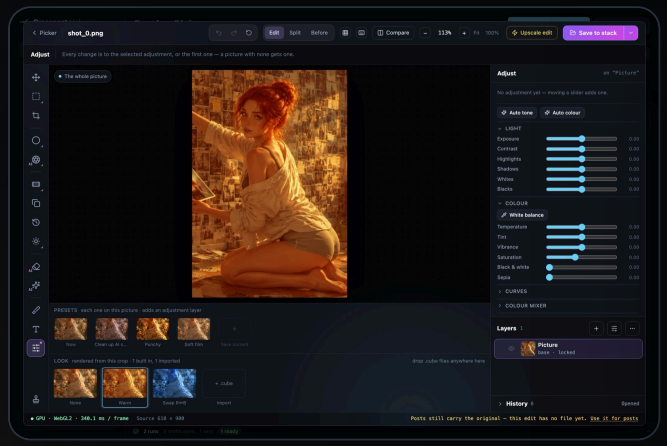

Runs
Plan one picture for several accounts, with the words for each written in one sitting, and send them when you are ready.

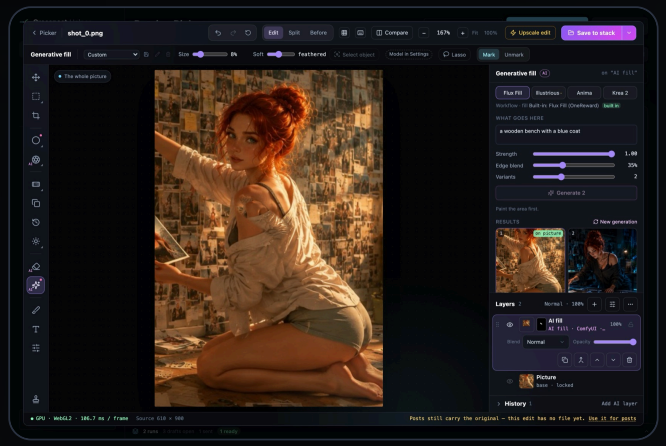

Made to fit
Character counters that count the way the platform does, Unicode text styles, and pictures cut into tiles for a carousel.

06 · EDITOR

Fix it before it goes out

A full picture editor built in, non-destructive from the first click. Save the edit and every post of that picture carries it; the original stays untouched.

Layers and masks
Pictures, adjustments, text and retouching as layers you can move, mask and blend.

Grading on the GPU
Light, colour, curves, colour wheels, sharpening, clarity, dehaze and noise reduction, plus LUT looks with a strength slider.

Repair
Heal, clone, dodge and burn, and AI remove and fill with Flux Fill, Illustrious, Anima or Krea 2 through ComfyUI, or with Ideogram or Wavespeed.

Select, mask, blur
Select the subject in one click, lay gradient masks, and fake a depth of field from the picture's own depth.

Captions and watermarks
That follow the crop, and export presets per account.

07 · UPSCALE & ANIMATE

Bigger pictures, moving pictures

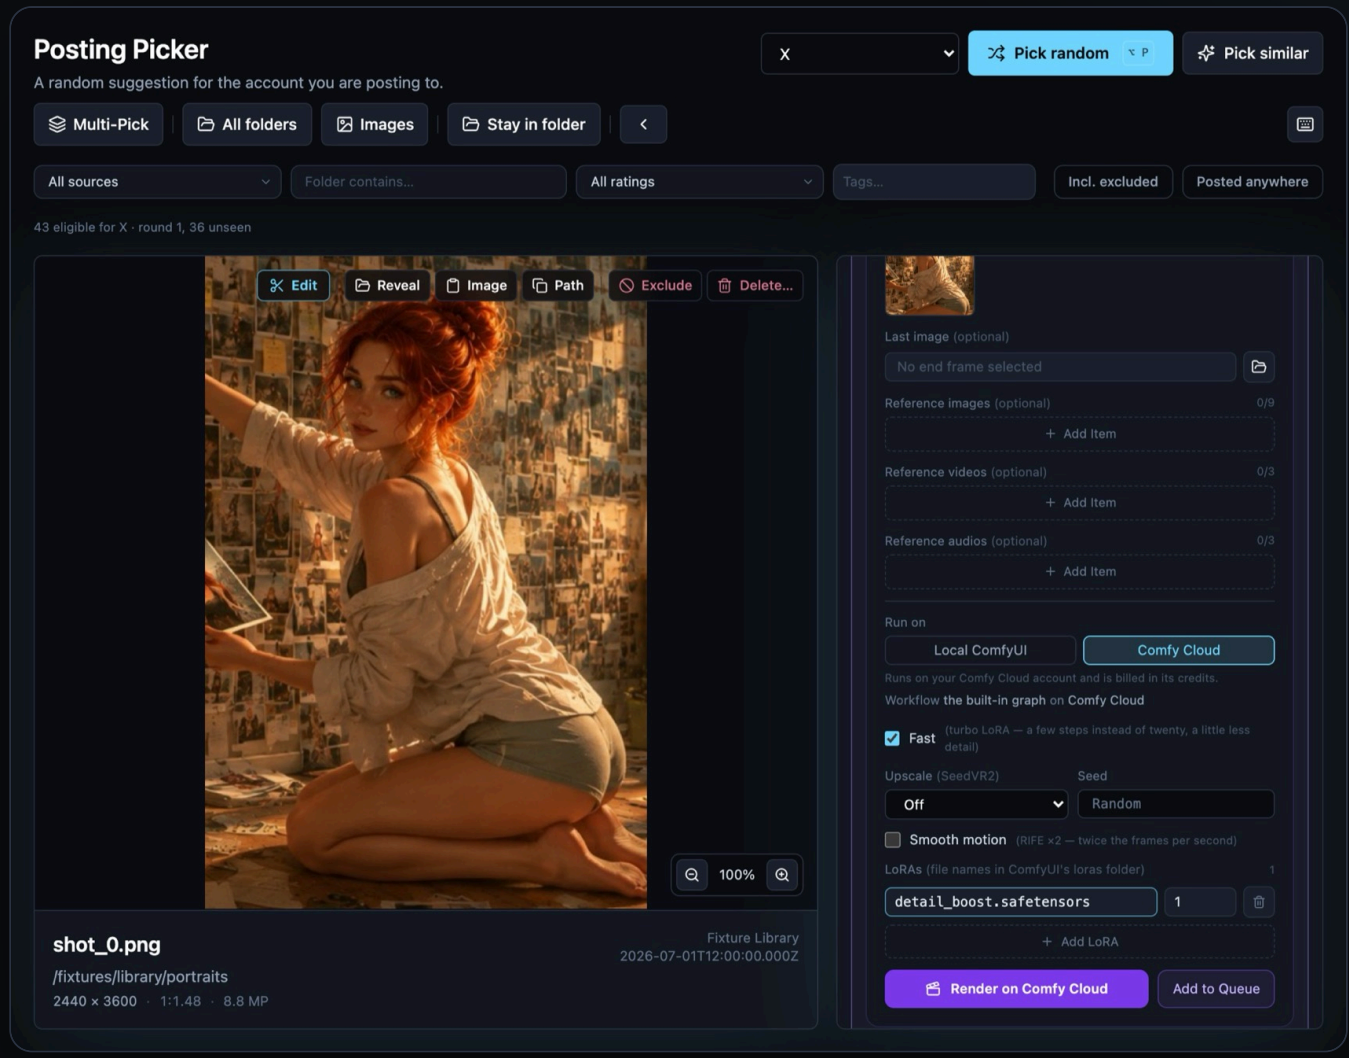

Send a picture to an upscaler or turn it into a clip without exporting anything. Every job shows up in the status bar and survives a restart.

Upscale
Topaz and Magnific (Creative, Precision V2, Relight, Skin enhancer). The result joins the picture's stack.

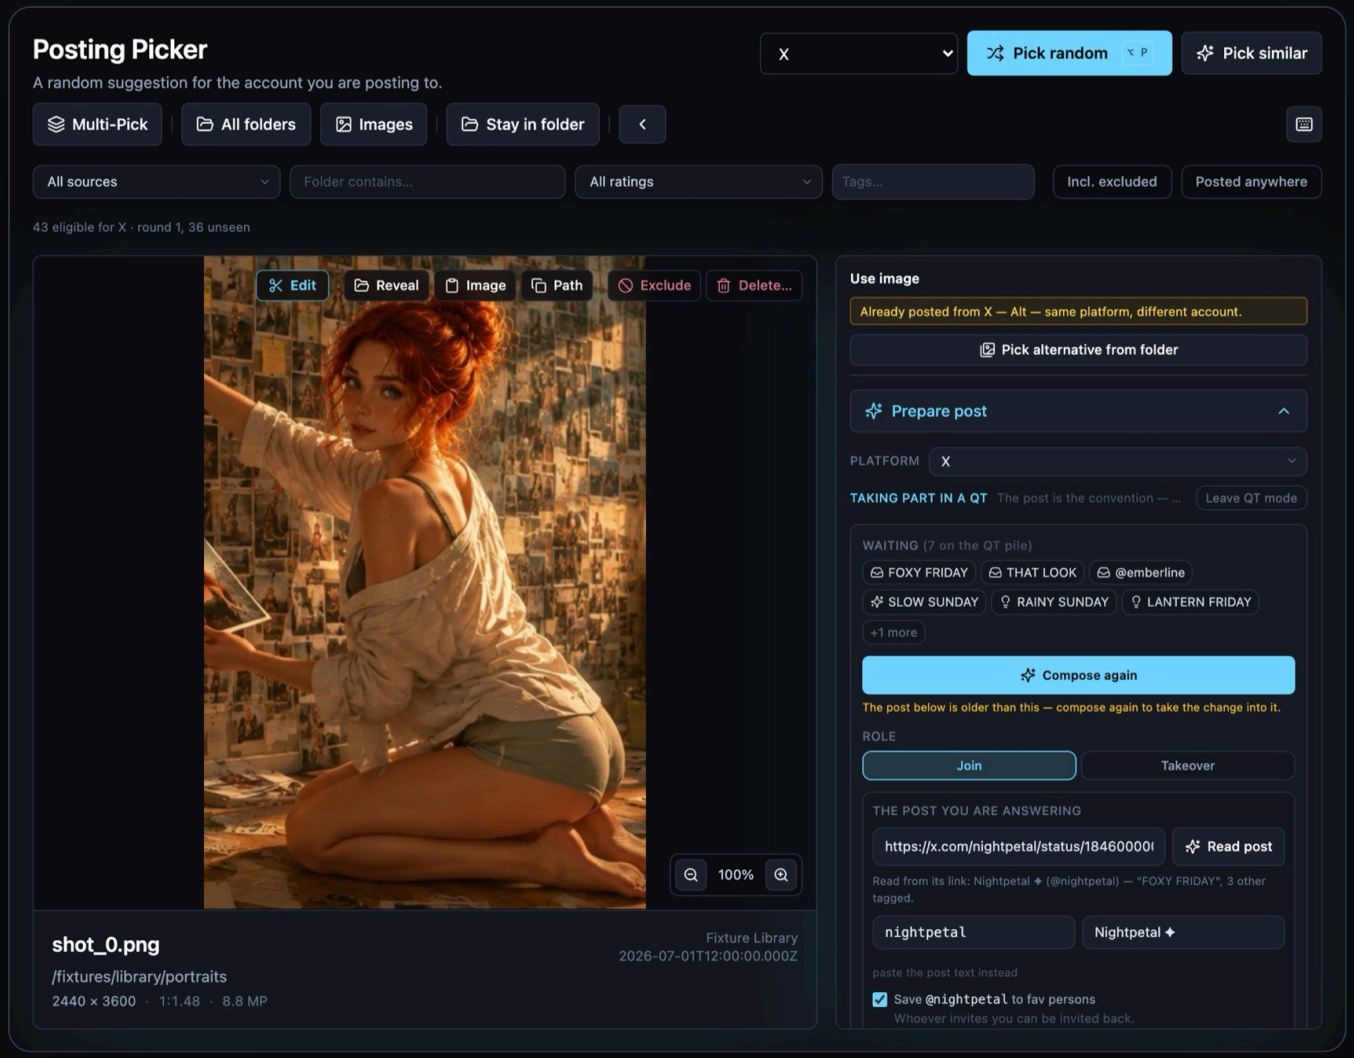

Video
Wavespeed's and Higgsfield's models, and WAN 2.2 or MiniMax H3 through ComfyUI on your own GPU, Comfy Cloud or RunningHub.

Your own workflows
Load your ComfyUI graph and the app finds where the picture and the prompt go.

A queue that waits
Line jobs up and let them run while you get on with posting.

Turning the picked picture into a clip with ComfyUI.

Taking part in a QT: the pile is one click away, the post is written for you.

08 · QTS

Never miss an invitation

Quote-tweet events are how art communities on X meet. The app keeps every QT you were tagged into, found or planned yourself, in one pile, sorted by what is due first.

Collect from the browser
One click in the extension puts a QT on the pile, with its theme and its author.

Participate
Pick the pictures, and the app writes the post: the theme, the credit and the people you tag.

Who to tag
Drawn from the people you keep, weighted by how close they are and who tagged you lately.

What is going around
Themes that several people are running, and the weekdays they run on.

Know who you are posting for

The extension reads the pages you open yourself: notifications, profiles, your own posts. It never posts, follows or likes anything for you, and never runs on a timer.

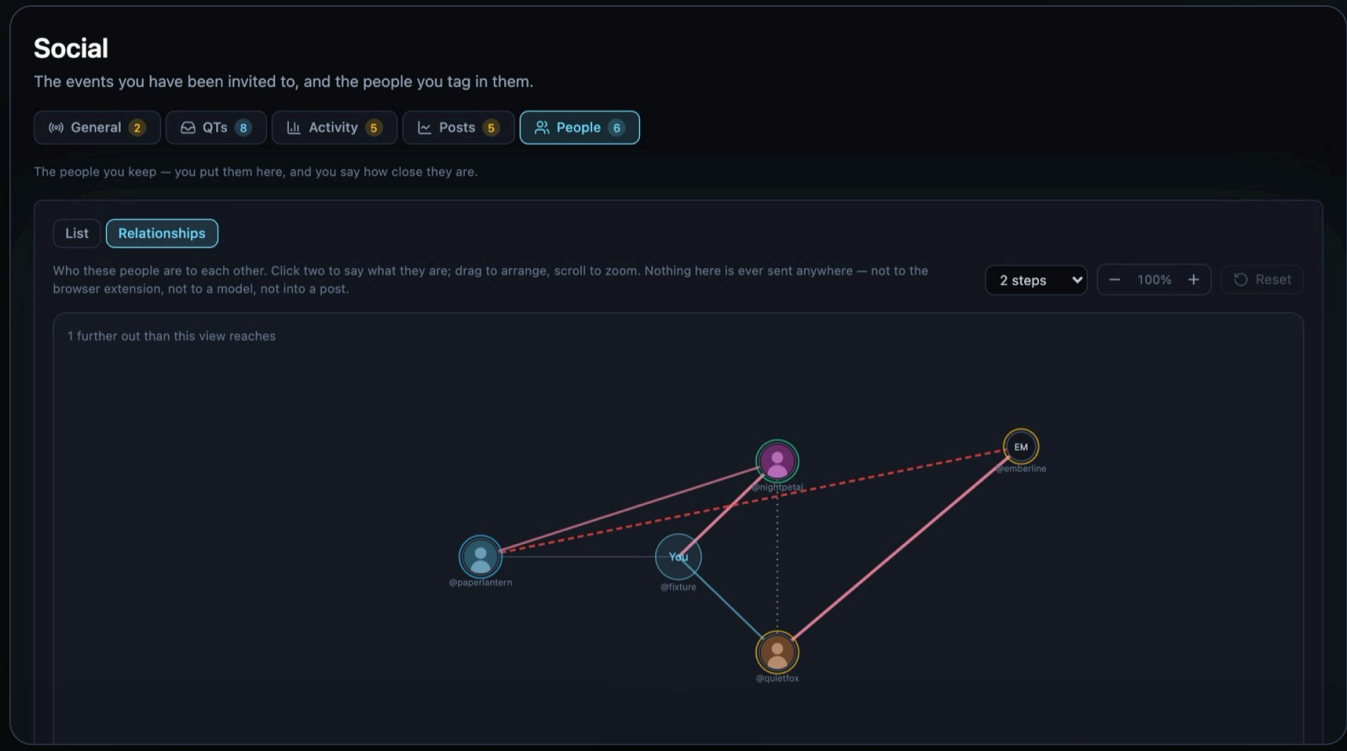

People
A list of the people you care about, rated by closeness, with who follows whom.

Who is waiting on you
Replies and mentions addressed to you, apart from the threads you only happen to be in.

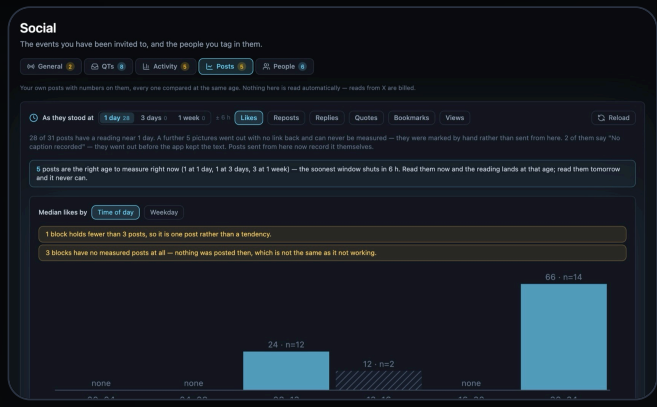

Give and take
Who keeps showing up for you, and who you have not answered in a while.

A daily round
A short list of people to visit today.

How your posts did
Compared at the same age, so a post read after two hours is never held against one read after three days.

10 · AROUND THE APP

On your phone, in your browser, next to your generator

PHONE

Your library in your pocket

Switch it on, scan a QR code, and browse, pick, triage and post from your phone on your home network. Nothing goes through the internet.

BROWSER EXTENSION

The bridge to the platforms

For Chrome and Firefox. Fills in posts, collects QTs and pictures, and reads the pages you open for the Social view.

REFERENCE LIBRARY

Pictures to learn from

Import from Civitai with the prompt and the settings, keep versions of a prompt, and search it like the library.

PROMPTING HELPER

Works with its sibling app

Shares the Reference Library, takes the keepers you flag there straight past Triage, and writes posts for its renders.

What you need

Runs on	Windows, macOS and Linux.
Your pictures	Any folder on your computer, including folders a generator writes into. The app indexes them where they are.
AI writing	Optional. Your own key for OpenAI, Anthropic, Grok (xAI) or Gemini.
Upscale & video	Optional. Topaz, Magnific, Wavespeed or Higgsfield keys, and ComfyUI on your own computer, Comfy Cloud or RunningHub.
Posting	X, Bluesky and Civitai directly; X, Bluesky and DeviantArt through the browser extension.
Your data	Stays on your disk, with backups you can restore from Settings.

Download

The latest release, the release notes and the wiki are at

`github.com/valerie-4659/crossposthelper-app/releases`

The app tells you when a new version is out. Questions and bug reports go to the issues on the same page.

Made by an artist who posts every day, for the part of making pictures nobody talks about: getting them out there.
